

Installation Guide

Deploy a Fire or EMS service, understand what is automatic, and keep one clear configuration path.

Version OPERIA 5.0.223	Manager 1.1.152	Audience Administration / Command
---------------------------	--------------------	--------------------------------------

This guide matches the current modern panels. Historical Gaétan/LSFD paths are not part of new OPERIA installations.

1. Before you start

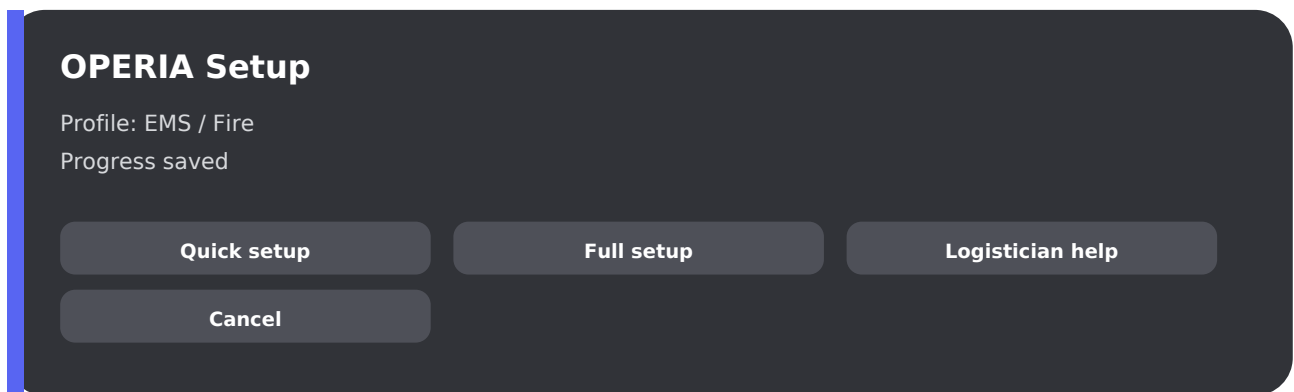

OPERIA is provisioned as a managed instance. The bot needs the permissions required to create and manage the resources you explicitly ask it to create.

Choose one profile: Fire or EMS. The website is best for visual/heavy configuration; Discord remains the daily operational surface.

- Prepare a private command channel.
- Place the logistician role above the roles it must manage.
- Keep real service documents/protocols ready for AI-assisted import.

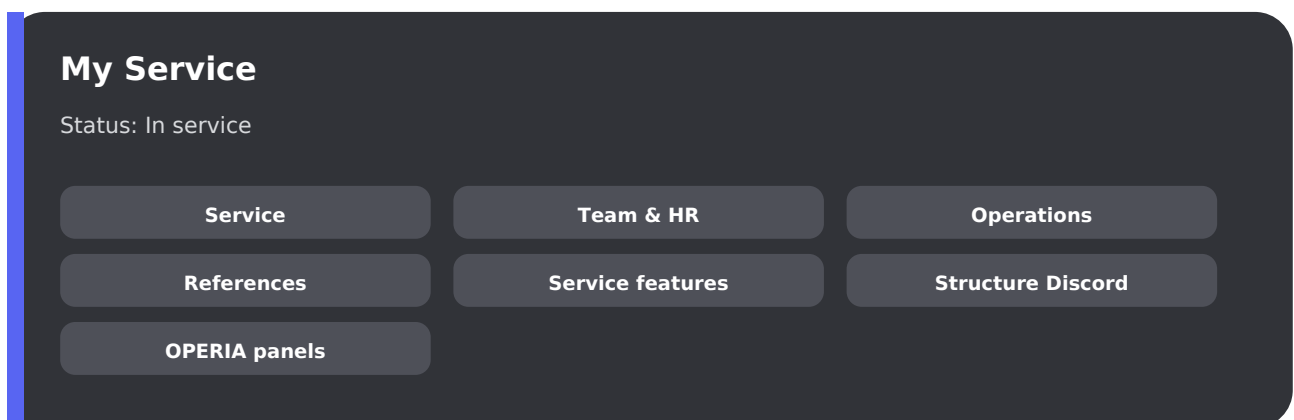

2. Starting setup

The permanent OPERIA Center starts setup. Setup can be quick or full. Incomplete setup keeps its progress; Cancel Setup only cleans resources whose OPERIA provenance can be proven.

3. My Service becomes the root

After go-live, My Service is the canonical root. Home returns to My Service; Back returns to the previous surface; Close closes the private surface. Old configuration hubs must not reappear.

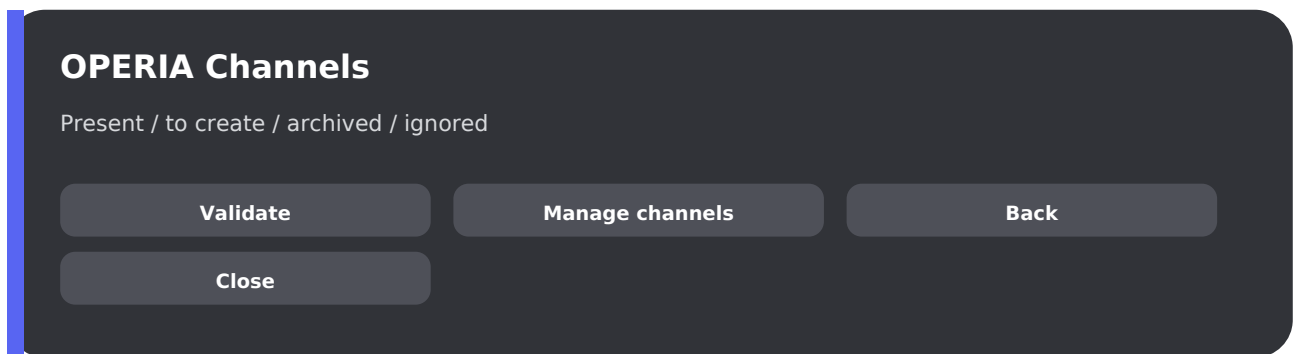

4. Discord structure and channels

From My Service, Discord Structure opens OPERIA Channels directly. The redundant intermediate “Channels” screen is gone. Standard and custom channels appear in a paginated plan.

Adding a custom channel follows: category → emoji → name. OPERIA normalizes the name automatically, e.g. citizen discussion + icon → icon●citizen_discussion. The channel is added to the plan and is only created when Validate is pressed.

A custom category can also be created from Manage Channels. OPERIA applies its category visual standard and records provenance proof.

5. Grades and roles

Catalog order is prepared before Discord creation. A new post-installation grade is explicitly marked pending; no role is created before Validate. Validate creates/reuses only the targeted grade and moves it relative to catalog neighbors.

- No name-based duplicate creation.
- No heuristic movement of Command.
- Pre-existing/adopted roles remain protected.

6. Operations: vehicles, units, calls and locations

The visible flow groups Vehicles & Units. The vehicle is the physical asset; the Dispatch unit remains an internal compatibility object. Call types and operational locations are configurable without code.

- Callsign prefixes suggested automatically (AMB, SUP, INC, etc.).
- Configurable standby points and destinations.

7. References and documents

Radio codes, protocols, rates, logos and other documents can be imported from PDF, image/screenshot or text. Real source material is always authoritative: OPERIA may extract and reformat, but must not invent a missing rule, rate or protocol.

- Source → extraction → human review → approved data → official document.

8. AI logistician and service memory

The logistician knows the Discord structure visible to both the requester and the bot, plus a small recent snapshot of authorized channels. Command can explicitly ask it to create a category, text/voice channel, or permissionless role. Deletions, permission edits, role assignment and moves remain outside autonomy.

Operational memory is isolated per service. It stores only non-personal trends and can be reviewed or cleared by administration.

9. Probation and intelligent exam

The probation exam can be built manually or generated by OPERIA AI from approved service sources. Every proposal must include a source and exact verifiable excerpt. Administration keeps/edits/removes proposals before adding them to the official bank.

The validated universal bank is the source of truth for the real Training exam, including configured question count and passing score.

10. Publication and final verification

Validate remains the application boundary for planned resources. OPERIA Panels is the single post-installation publish/repair surface. Diagnostics checks real functions and useful logs; historical routes are not normal destinations.

- Test Home, Back and Close.
 - Test a custom channel before/after Validate.
 - Test a probation exam and an EMS report.
-
